Informational Issues

I-01. Redeeming wrapper shares can bridge fewer raw shares and overstate the bridged amount in the event

Description: BackedCCIPWrapperBridgeAdapter redeems amount of wrapped stock shares and subsequently bridges the nominal stock token amount returned by redeem():

```
uint256 rawAmount = IERC4626(token).redeem(
    amount, address(this), address(this)
);

IERC20(raw).forceApprove(address(ccipBridge), rawAmount);
bytes32 messageId = ccipBridge.send{ value: fee }(
    selector, receiver, raw, rawAmount, ""
);

emit BridgeBackedCCIPWrapper(
    token, amount, raw, rawAmount, destRecipient, messageId
);
```

However, the underlying stock token internally uses a rebasing share-based accounting model, where ERC-20 token amounts are converted into underlying shares using integer division.

As a result, redeeming wrapped stock shares and subsequently transferring the returned stock token amount introduces two consecutive rounding-down operations, potentially resulting in fewer underlying stock shares being transferred than the number of wrapped stock shares burned.

Additionally, the emitted bridge event exposes the originally provided shares, instead of the actual shares transferred.

Recommendation: Consider emitting the actual number of shares.

Customer's response: Fixed in commit 95eb553c

Fix Review: Fixed

About Certora

Certora is a Web3 security company that provides industry-leading formal verification tools and smart contract audits. Certora's flagship security product, Certora Prover, is a unique SaaS product that automatically locates even the most rare & hard-to-find bugs on your smart contracts or mathematically proves their absence. The Certora Prover plugs into your standard deployment pipeline. It is helpful for smart contract developers and security researchers during auditing and bug bounties.

Certora also provides services such as auditing, formal verification projects, and incident response.
